## Answer All questions

11 a) A Company sells two different products A, and B making a profit of Rs40 and Rs30 per unit on them, respectively. They are produced in a common production process and are sold in two different markets. The production process has a total capacity of 30,000 man-hours. It takes three hours to produce a unit of A and one hour to produce a unit of B.The market has been surveyed and company officials feel that the maximum number of units of A that can be sold is 8000 units and that of B is 12000 units. Subject to these limitations product can be sold in any combination. Formulate this problem as an LP model to maximize profit.
